

Cyber Cafe Management System

Abstract:

The Cyber Cafe Management System is a comprehensive web-based application developed to efficiently handle the operations of a cyber cafe. It provides functionality to add and manage computers, enabling administrators to keep track of each system's details and status. The system also supports user management, allowing the registration of new users and the ability to view detailed records of both new and old users, as well as all users collectively.

Additionally, it includes a robust search feature, enabling administrators to quickly retrieve user information based on specific criteria. One of the key highlights of the system is its reporting feature, which allows the generation of detailed reports for user activities and system usage within a specified date range. This capability is particularly useful for analyzing performance, tracking usage trends, and maintaining accurate records. Designed for efficiency and scalability, the system simplifies the management process, reduces administrative workload, and enhances the overall operational effectiveness of a cyber cafe..
