

Old age Home Management system

Abstract:

The Old Home Management System is a comprehensive web-based platform developed in PHP, aimed at providing dedicated care and support to the elderly. Recognizing the unique challenges faced by seniors, especially during post-surgery recovery or periods of limited mobility, the platform is designed to assist families in ensuring their loved ones receive personalized attention and care. The elderly often prefer the comfort of their own homes, and this system facilitates managing their daily routines without requiring constant supervision from family members. Key features of the platform include caregiver assignment, real-time health monitoring, scheduling assistance, and management of essential services like meal planning and medication reminders. The platform ensures that seniors receive the care they need while allowing family members to stay connected and updated remotely. It also helps reduce the emotional and logistical stress on families by streamlining the care process.
