Salon booking system

Abstract:

The Salon Management System is a PHP-based web application designed to streamline the operations of salons by providing an efficient platform for managing appointments, customer details, and services. This system allows both salon staff and customers to interact seamlessly, enabling users to view available services, schedule appointments, and manage bookings online. Salon owners can easily track customer histories, manage service pricing, and handle payments. The system also provides features for staff scheduling and inventory management, ensuring smooth day-to-day operations. By automating and centralizing salon management tasks, the project improves efficiency, reduces administrative workload, and enhances the overall customer experience, making it an essential tool for modern salons.
